Mapping Our Ecological Footprints

The illusion of sustainable production -- from restoring resources and the environments to global ecological harmony.

We Live In

Extraction

The Social Cost of Minerals

Consolt local and indigenous communities; respect their knowledge and connection to the land.

Responsible mining implements transparency, accible to all, minimising and mitigating environmental impacts, respecting human rights, ensuring worker safety, engaging with communities, and fostering long-term social and economic development.

Etc.

The Large Footprint of Mining

Alternative extractions - using low impact methods to limit surface land disturbance and water destruction.

Replace coal-powered mining operations with onsite solar, wind, and or hydroelectric microgrids.

Etc.

Solutions

Pollution

Land Pollution

Recyling - minimize use of plastics, learning how to properly recyle because there are many things that are not recyclable

Composing organic matter - turning food waste into fetalizer instead of ending up in landfills

Sustainable farming, cutting chemical use, and Bioremediation.

Recycle industrial waste and reforestation.

Etc.

Ocean Pollution

Reduce single use plastics - swapping to reusable alternatives.

Be aware and choose non-toxic chemicals.

Conserve water and reduce waste at home.

Respecting ocean habitats

Etc.

Air Pollution

Change in transportation - walking, commuting, carpool, bikes, less driving

Limit setting fires, such as burning of coal.

Less energy use

Taking care of plants and trees; Reforestation.

Etc.

Climate

Climate Change

Transition to renewables

Sustainable transits

Forest and oceans play a vital role in regulating climate, so addressing land and ocean pollution is important.

Etc.

Fossil Fuels

Sustainable transits

Solar and wind powers

Limting fires

Less enrgy usage

Etc.

Consumption

Overconsumption

Limit to only buying things you truly need

Reusing and repairing (Ex. Patagonia, thrift shopping)

Etc.
